I. INSTALLATION

1. Unzip all files
2. Open process-form.php
3. Enter valid values for:
    a. **$email_address** – This is the email address that all submitted forms will be sent to
    b. **$company_address** – This is the address that will be displayed on the Google Map.
4. Open contact.php
5. Update your address information in the section with class="contact-info"

II. ADDING AND REMOVING FIELDS

Thanks to HTML5, this process is extremely simple. To remove a field from the form, delete the field from contact.php. There is no need to make any changes to the JavaScript.

To add a field to the form, update contact.php with the new field information using the appropriate HTML5 field types and properties. For example, if you wanted to add a field called Website you would add the following:

```
<div class="field">
        <label for="website">Phone</label>
        <input type="url" id="website" name="website" required>
</div>
```

If you are unfamiliar with the new field attributes, you should read the following article:
